

Docket No. SHAI-11

IN THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application:

1. (previously presented) In a system for sending messages over a network between first and second computing units, method comprising the following steps:

(a). computing r components of encrypting key $e_{\text{sub.1}}, e_{\text{sub.2}}, \dots, e_{\text{sub.r}}$ and r components of decrypting key $d_{\text{sub.1}}, d_{\text{sub.2}}, \dots, d_{\text{sub.r}}$ according to the following relations:

$$(e_{\text{sub.1}}).(d_{\text{sub.1}})+(e_{\text{sub.2}}).(d_{\text{sub.2}})+\dots$$

$$+(e_{\text{sub.r}}).(d_{\text{sub.r}})=(k_{\text{sub.1}}).(p-1).(q-1)+1 \text{ and}$$

$$(d_{\text{sub.1}})+(d_{\text{sub.2}})+\dots+(d_{\text{sub.r}})=(k_{\text{sub.2}}).(p-1).(q-1), \text{ where:}$$

p and q are two prime numbers;

$k_{\text{sub.1}}$ and $k_{\text{sub.2}}$ are suitable integers; and

encrypting a message M into r cipher versions $M_{\text{sub.1}}, M_{\text{sub.2}}, \dots, M_{\text{sub.r}}$ using the r blinded components of the encrypting key $e_{\text{sub.1}}+t, e_{\text{sub.2}}+t, \dots, e_{\text{sub.r}}+t$ as follows:

$$M_{\text{sub.1}}=(M_{\text{sup.}}(e_{\text{sub.1}}+t)) \bmod n$$

$$M_{\text{sub.2}}=(M_{\text{sup.}}(e_{\text{sub.2}}+t)) \bmod n$$

\dots

$$M_{\text{sub.r}}=(M_{\text{sup.}}(e_{\text{sub.r}}+t)) \bmod n, \text{ where:}$$

$$n=p.q;$$

t is a random number generated on an encrypting unit and discarded after encryption is complete;

Docket No. SHAI-11

mod represents the remainder left when left hand operand is divided by right hand operand;

(b). delivering all the cipher versions of the message individually to a destination unit in source routing mode, or hop-by-hop routing mode with a small time gap between every two consecutive cipher versions;

(c). collecting all the cipher versions at the destination unit;

(d). computing r number of values $N_{\text{sub.1}}, N_{\text{sub.2}}, \dots, N_{\text{sub.r}}$ using r components $d_{\text{sub.1}}, d_{\text{sub.2}}, \dots, d_{\text{sub.r}}$ of decrypting key, where:

$$N_{\text{sub.1}} = ((M_{\text{sub.1}})_{\text{sup.}(d_{\text{sub.1}})}) \bmod n$$

$$N_{\text{sub.2}} = ((M_{\text{sub.2}})_{\text{sup.}(d_{\text{sub.2}})}) \bmod n$$

...

$$N_{\text{sub.r}} = ((M_{\text{sub.r}})_{\text{sup.}(d_{\text{sub.r}})}) \bmod n, \text{ where:}$$

n is the same composite number as used for encryption;

(e). reproducing the original message M as follows:

$$M = (N_{\text{sub.1}}) \cdot (N_{\text{sub.2}}) \cdot \dots \cdot (N_{\text{sub.r}}) \bmod n, \text{ where:}$$

n is the same composite number as used for encryption;

wherein $r=2$.

2.-9. (Cancelled)

10. (previously presented) A system of claim 1, wherein at least one encrypted version of the message is bypassed to a secret host that is not exposed to the public while the remaining are directed to a main host, where the bypassed cipher versions are also collected from the secret host.

11. (Original) A system of claim 1, wherein redundant cipher versions of a

Amendment – Serial No. 09/847,503.....Page 3

Docket No. SHAI-11

message are generated and delivered to the destination, where they are identified and discarded before decryption.

12. (Original) A system of claim 10, wherein the cipher version received at a secret host is further encrypted in a symmetric key encryption method before sending it to the main host, where it is decrypted by the same symmetric key.

13. (previously presented) A system for sending messages over a communications channel, comprising:

an encoder to transform a message M into two or more cipher versions

M.sub.1, M.sub.2, . . . , M.sub.r as follows:

$$M_{\text{sub.1}} = (M_{\text{sup.}}(e_{\text{sub.1}} + t)) \bmod n$$

$$M_{\text{sub.2}} = (M_{\text{sup.}}(e_{\text{sub.2}} + t)) \bmod n$$

. . .

$$M_{\text{sub.r}} = (M_{\text{sup.}}(e_{\text{sub.r}} + t)) \bmod n, \text{ where:}$$

t is a random number generated on an encrypting machine;

e.sub.1, e.sub.2, . . . , e.sub.r are encrypting key components computed according to the relations:

$$(e_{\text{sub.1}})(d_{\text{sub.1}}) + (e_{\text{sub.2}})(d_{\text{sub.2}}) + \dots$$

$$+ (e_{\text{sub.r}})(d_{\text{sub.r}}) = (k_{\text{sub.1}})(p-1)(q-1) + 1$$

and

$$(d_{\text{sub.1}}) + (d_{\text{sub.2}}) + \dots + (d_{\text{sub.r}}) = (k_{\text{sub.2}})(p-1)(q-1);$$

p and q are prime numbers, and $n = p \cdot q$;

k.sub.1 and k.sub.2 are suitable integers;

(d.sub.1), (d.sub.2), . . . , (d.sub.r) are components of an other key used by a recipient for decrypting the cipher versions into the original message;

Docket No. SHAI-11

a decoder coupled to receive the cipher versions $M_{\text{sub.1}}, M_{\text{sub.2}}, \dots, M_{\text{sub.r}}$ from the communications channel and to transform them back to the original message M , where M is a function of $M_{\text{sub.1}}, M_{\text{sub.2}}, \dots, M_{\text{sub.r}}$ and computed as follows:

$$N_{\text{sub.1}} = ((M_{\text{sub.1}})_{\text{sup.}}(d_{\text{sub.1}})) \bmod n$$

$$N_{\text{sub.2}} = ((M_{\text{sub.2}})_{\text{sup.}}(d_{\text{sub.2}})) \bmod n$$

...

$$N_{\text{sub.r}} = ((M_{\text{sub.r}})_{\text{sup.}}(d_{\text{sub.r}})) \bmod n$$

$$M = (N_{\text{sub.1}})(N_{\text{sub.2}}) \dots (N_{\text{sub.r}}) \bmod n.$$

wherein $r=2$.

14. (previously presented) A computer-readable medium having computer-executable instructions causing a computer to compute the following: key components $(e_{\text{sub.1}}), (e_{\text{sub.2}}), \dots, (e_{\text{sub.r}})$ and $(d_{\text{sub.1}}), (d_{\text{sub.2}}), \dots, (d_{\text{sub.r}})$ according to the relations as follows:

$$(e_{\text{sub.1}})(d_{\text{sub.1}}) + (e_{\text{sub.2}})(d_{\text{sub.2}}) + \dots + (e_{\text{sub.r}})(d_{\text{sub.r}}) = (k_{\text{sub.1}})(p-1)(q-1)+1 \text{ and } (d_{\text{sub.1}}) + (d_{\text{sub.2}}) + \dots + (d_{\text{sub.r}}) = (k_{\text{sub.2}})(p-1)(q-1),$$

where: p and q are prime numbers; and $k_{\text{sub.1}}$ and $k_{\text{sub.2}}$ are suitable integers; cipher versions of the original message M as follows:

$$M_{\text{sub.1}} = (M_{\text{sup.}}(e_{\text{sub.1}}+t)) \bmod n \quad M_{\text{sub.2}} = (M_{\text{sup.}}(e_{\text{sub.2}}+t)) \bmod n \dots$$

$M_{\text{sub.r}} = (M_{\text{sup.}}(e_{\text{sub.r}}+t)) \bmod n$, where: t is a random number generated on an encrypting machine and discarded after encryption is complete. original

$$\text{message as follows: } N_{\text{sub.1}} = ((M_{\text{sub.1}})_{\text{sup.}}(d_{\text{sub.1}})) \bmod n$$

$$N_{\text{sub.2}} = ((M_{\text{sub.2}})_{\text{sup.}}(d_{\text{sub.2}})) \bmod n \dots N_{\text{sub.r}} = ((M_{\text{sub.r}})_{\text{sup.}}(d_{\text{sub.r}})) \bmod n$$

$$M = (N_{\text{sub.1}})(N_{\text{sub.2}}) \dots (N_{\text{sub.r}}) \bmod n$$
